

IAEA/ESNM Webinar Series on basic NM

Stress Testing Protocols

Target audience

Nuclear medicine physicians and technologists as well as affiliated scientists with an interest in myocardial perfusion imaging.

Description

Stress testing is essential in the diagnosis of CAD. For myocardial perfusion imaging several stressors with different profiles and side effects are available for routine practice. It is essential for the practicing nuclear medicine physician and the technologist to have a good understanding of their physiological mechanisms, their indications and their side effects in order to select the most appropriate individual stress test.

This webinar provides an overview of the different stressors, the associated protocols, indications and contraindications as well as side effects.
